

Post-ENM Analysis

Elizabeth White
University of Florida

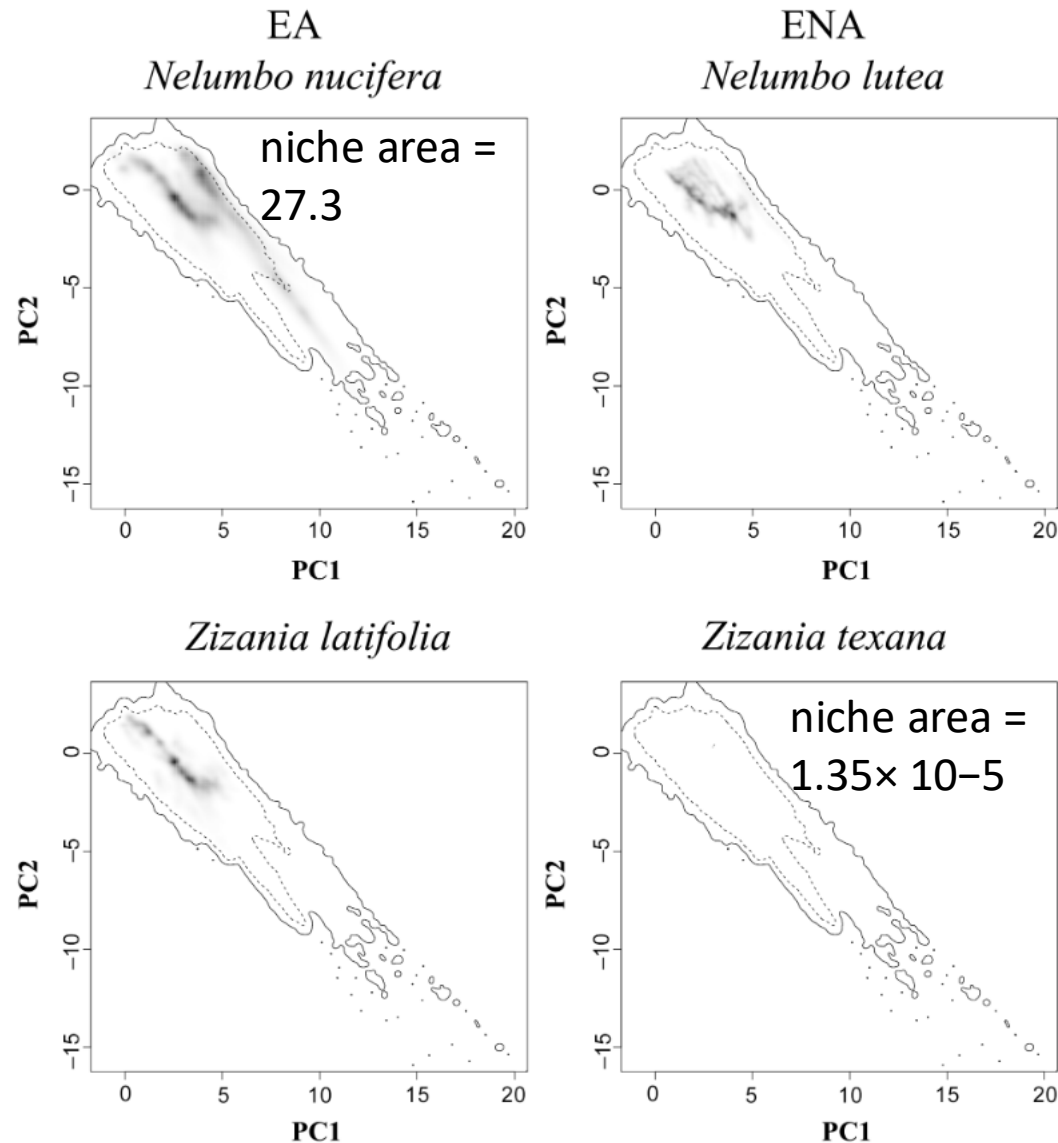

Post-ENM

- Analysis in environmental space
- Overview of commonly used post-modeling analyses.
 - **Niche Breadth**
 - **Niche Overlap**
 - Geographic Overlap
 - Niche Identity and Background test
 - **Age overlap correlation test**
- **Projecting models onto different climate scenarios (future)**

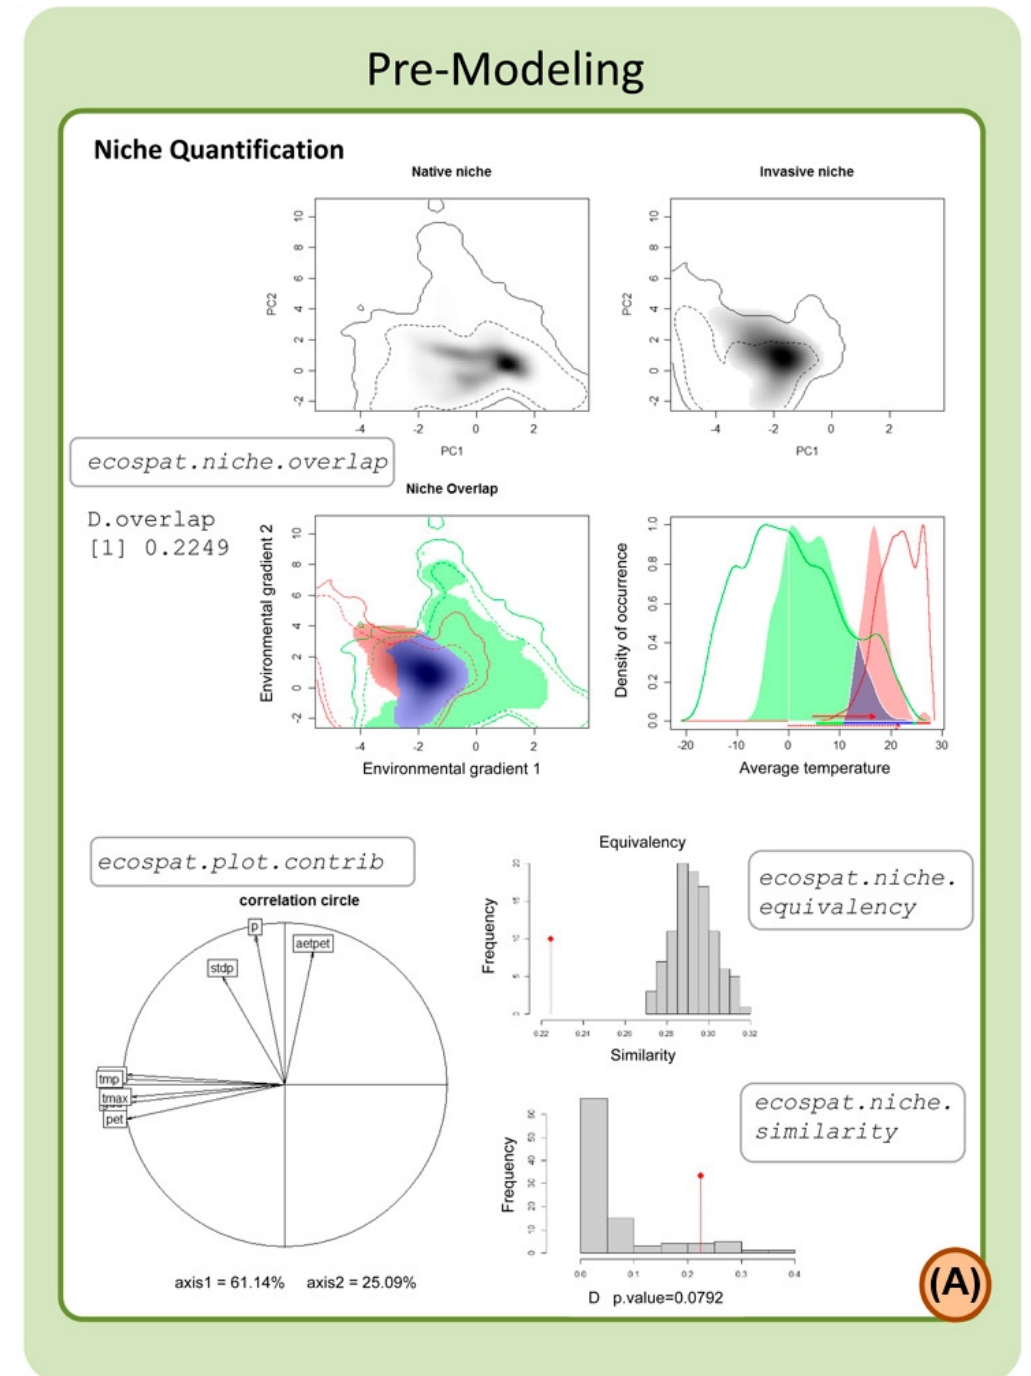

Analysis in environmental space

- **Quantifying niches in environmental space**
- Niche area is equal to the variance of ecological space along PC1 \times variance of ecological space along PC2
 - Larger niche area = more suitable area

Post-ENM Analyses

- **Niche occupancy**
- **Niche breadth**
- **Niche overlap** based on Schoener's D
- **Correlation circle**
 - Plots contribution of initial variables to variation seen in the data.
- **Niche Equivalency** (Graham et al. 2004)
 - Are the niche of two species indistinguishable?
- **Niche Similarity** (Peterson et al. 1999)
 - Can the niche of one species predict that of another?

Post-ENM Analyses

- Niche occupancy
- **Niche breadth**
- **Niche overlap** based on Schoener's D
- **Correlation circle**
 - Plots contribution of initial variables to variation seen in the data.
- **Niche Equivalency** (Graham et al. 2004)
 - Are the niche of two species indistinguishable?
- **Niche Similarity** (Peterson et al. 1999)
 - Can the niche of one species predict that of another?

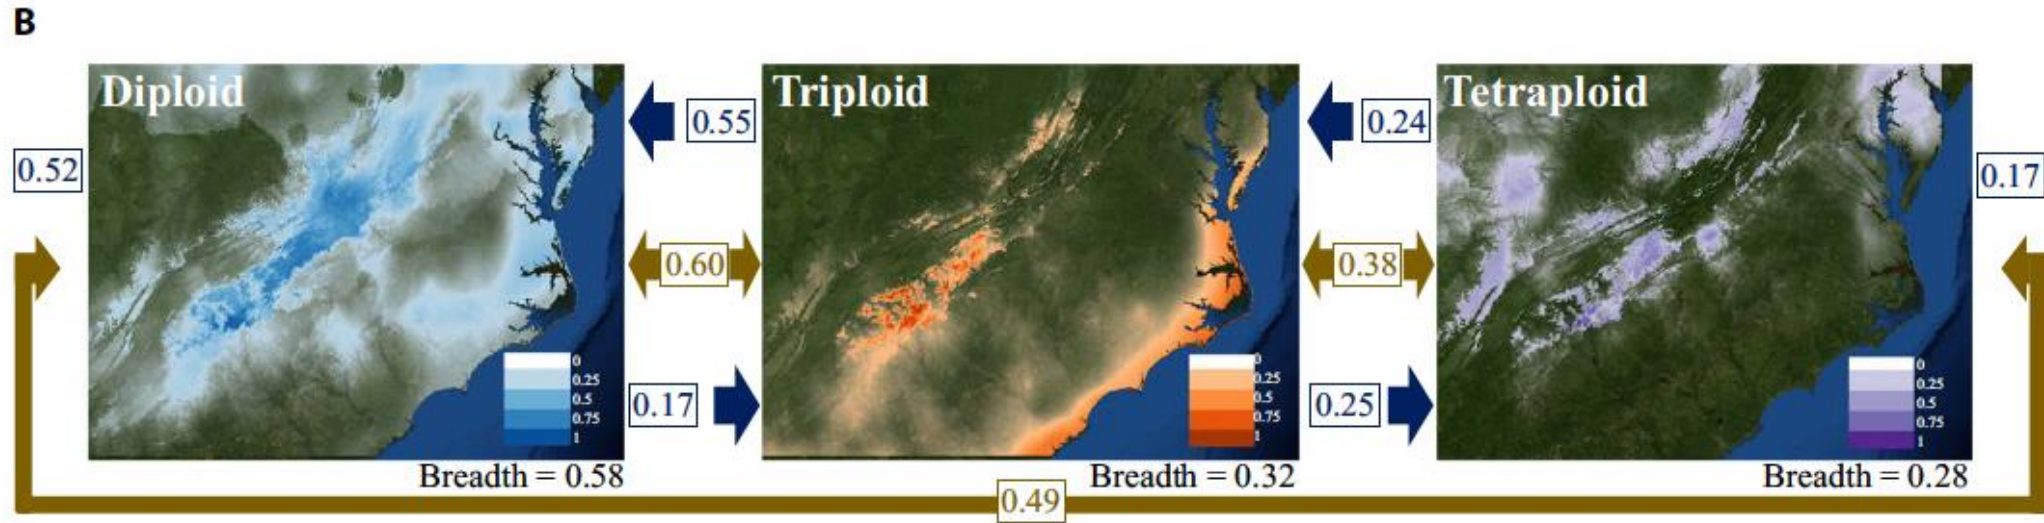

Post-ENM: Niche Breadth

Niche breadth:

- is a means of calculating the breadth of suitable climatic factors for a species, providing a value ranging from 0 to 1.
- larger values represent more generalist species with wider climatic tolerances
- smaller values represent more specialized species with more narrow tolerance

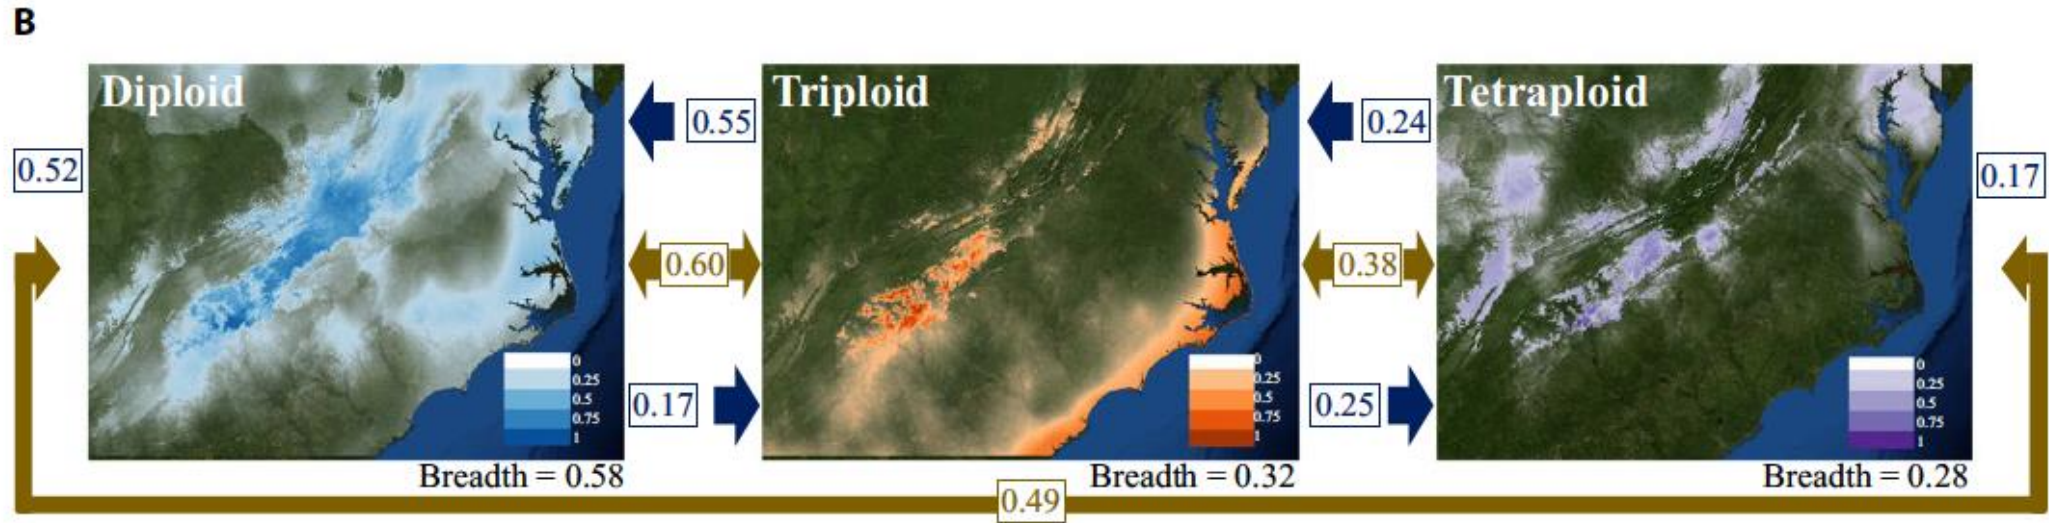

Post-ENM: Niche Overlap

Niche overlap (gold):

- Schoener's D ranges from 0 to 1
- 0 represents no niche similarity between the models
- 1 represents completely identical niches

Post-ENM: Niche Overlap

Niche overlap (gold):

- Schoener's D ranges from 0 to 1
- 0 represents no niche similarity between the models
- 1 represents completely identical niches

Geographic Overlap (blue):

- percentage of points found in the models A distribution relative to those in the model Bs distribution.

Niche Identity and Background Test

Niche Identity Test:

- **Niche Equivalency** (Graham et al. 2004)
 - Are the niches of two species indistinguishable?
- Compares niche models with the same number of occurrence records as the original models, but with randomly distributed localities x 100

Niche Background Test:

- **Niche Similarity** (Peterson et al. 1999)
 - Keep one species fixed, randomly sample the background of the other
 - Are niche more similar than expected by chance?

Warren et al. 2010. ENMTools: a toolbox for comparative studies of environmental niche models

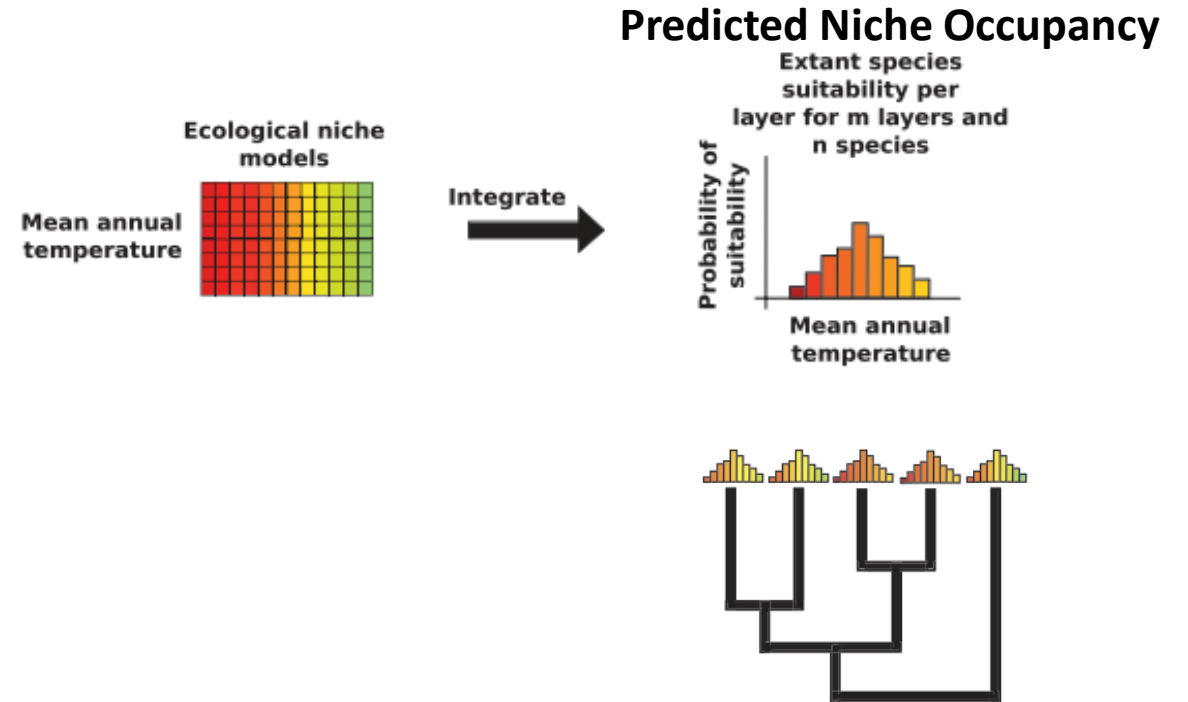

Niche and Phylogenetics

Point-Based

- Principal Component Analysis (PCA)
- Age-overlap correlation test:
 - Range & point based

Model-based

- Phylogenetic PCA (pPCA)
- Blomberg's K statistic and Pagel's lambda
- Ecological Niche Shifts
 - R package l1ou

Folk et al. 2018. The American Naturalist.

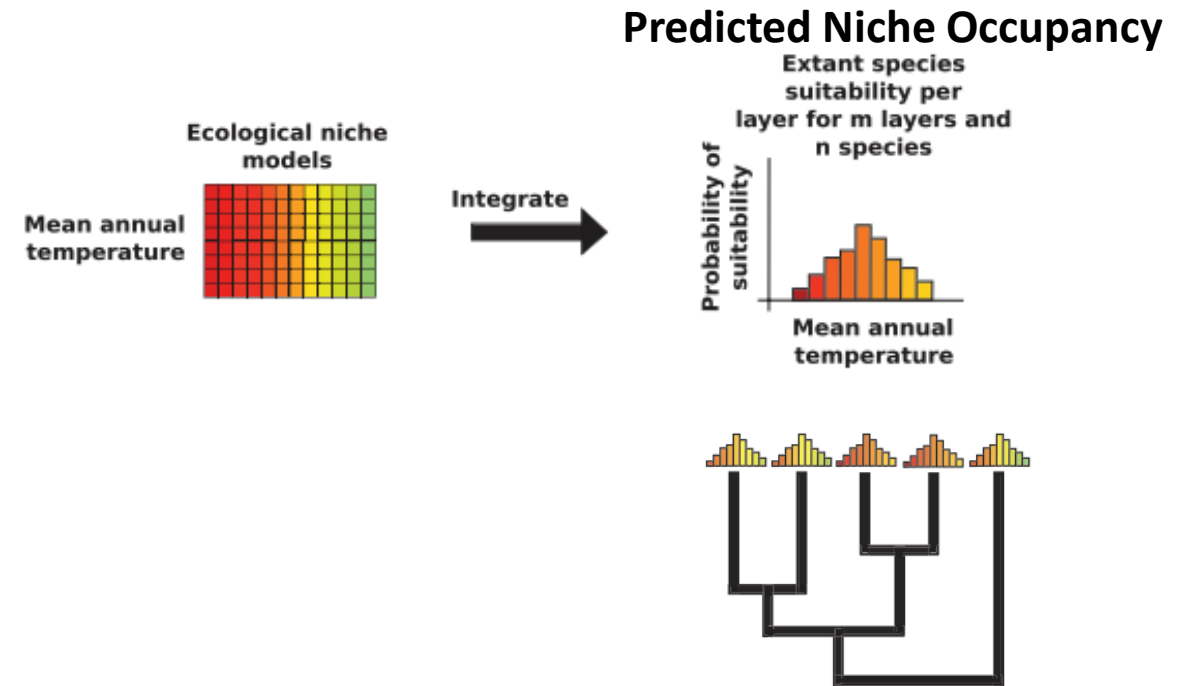

Niche and Phylogenetics

Point-Based

Age overlap correlation test

	Spatial overlap measure			Example of possible interpretations of overlap pattern
	Range Overlap	Point Overlap	Local co-occurrence	
(a) 	low	low	low	Allopatric speciation with broad geographic barrier as isolating mechanism
(b) 	high	low	low	Allopatric speciation with finer-scale landscape features as isolating mechanism
(c) 	high	high	low	Sympatric speciation with habitat filtering
(d) 	high	high	high	Sympatric speciation with ecological trait divergence

Cardillo and Warren. 2016. Global Ecology and Biogeography.

Age overlap correlation test

Age overlap correlation test

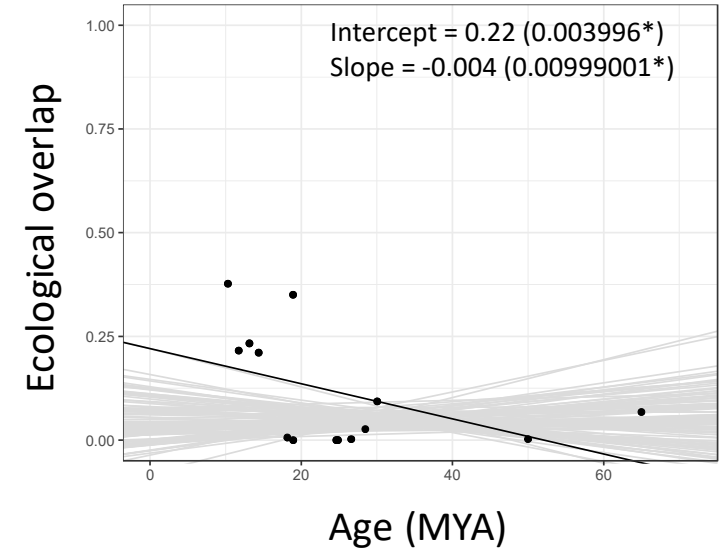

Mode of Speciation	Intercept	Slope
Sympatric	> 0.5	
Allopatric	< 0.5	positive
Parapatric	< 0.5	near or below 0

Fitzpatrick & Turelli. 2006. Evolution.

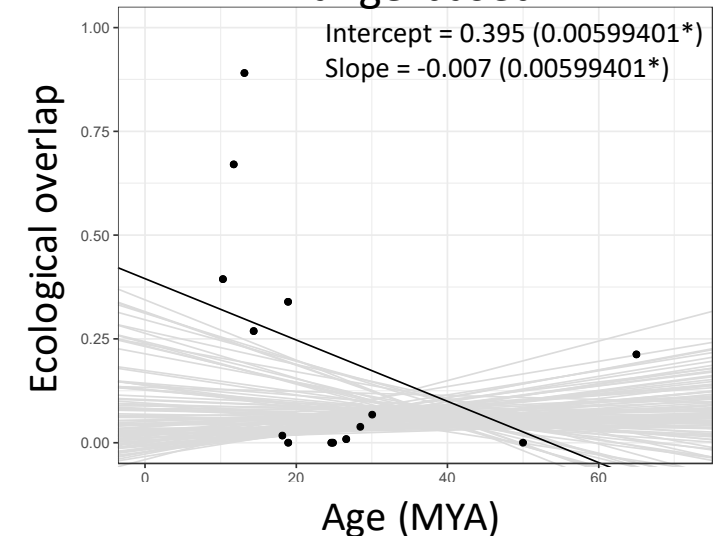

Age overlap correlation test

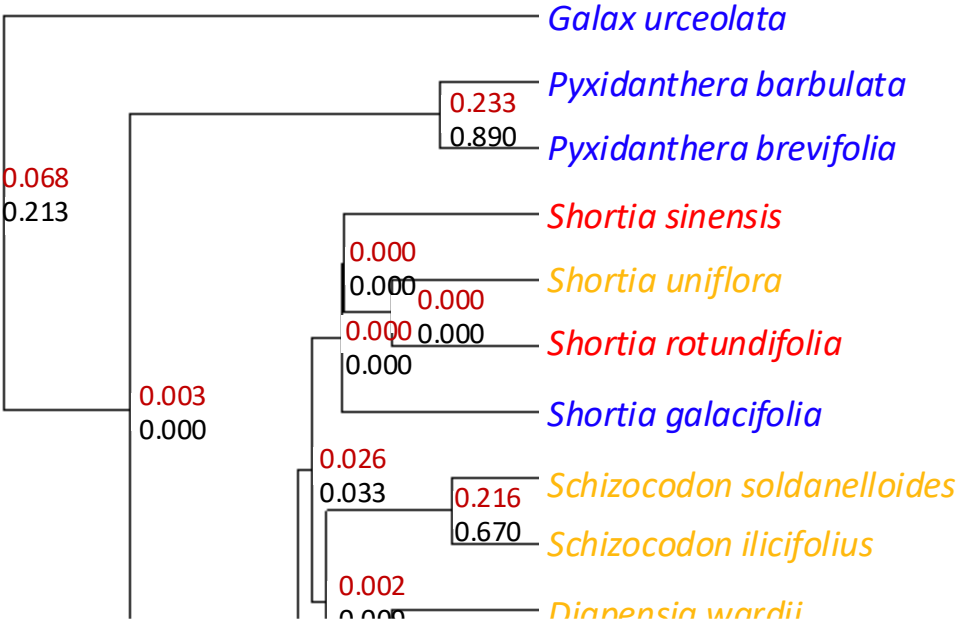

Point-based

Range-based

Age overlap correlation test

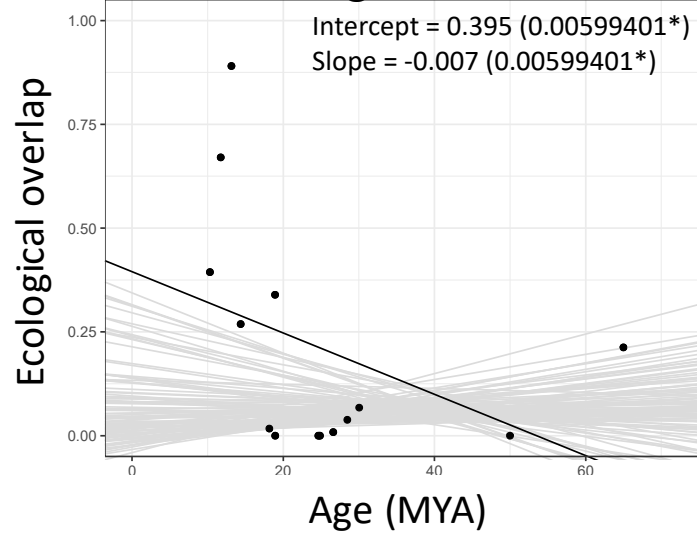

Mode of Speciation	Intercept	Slope
Sympatric	> 0.5	
Allopatric	< 0.5	positive
Parapatric	< 0.5	near or below 0

Point-based

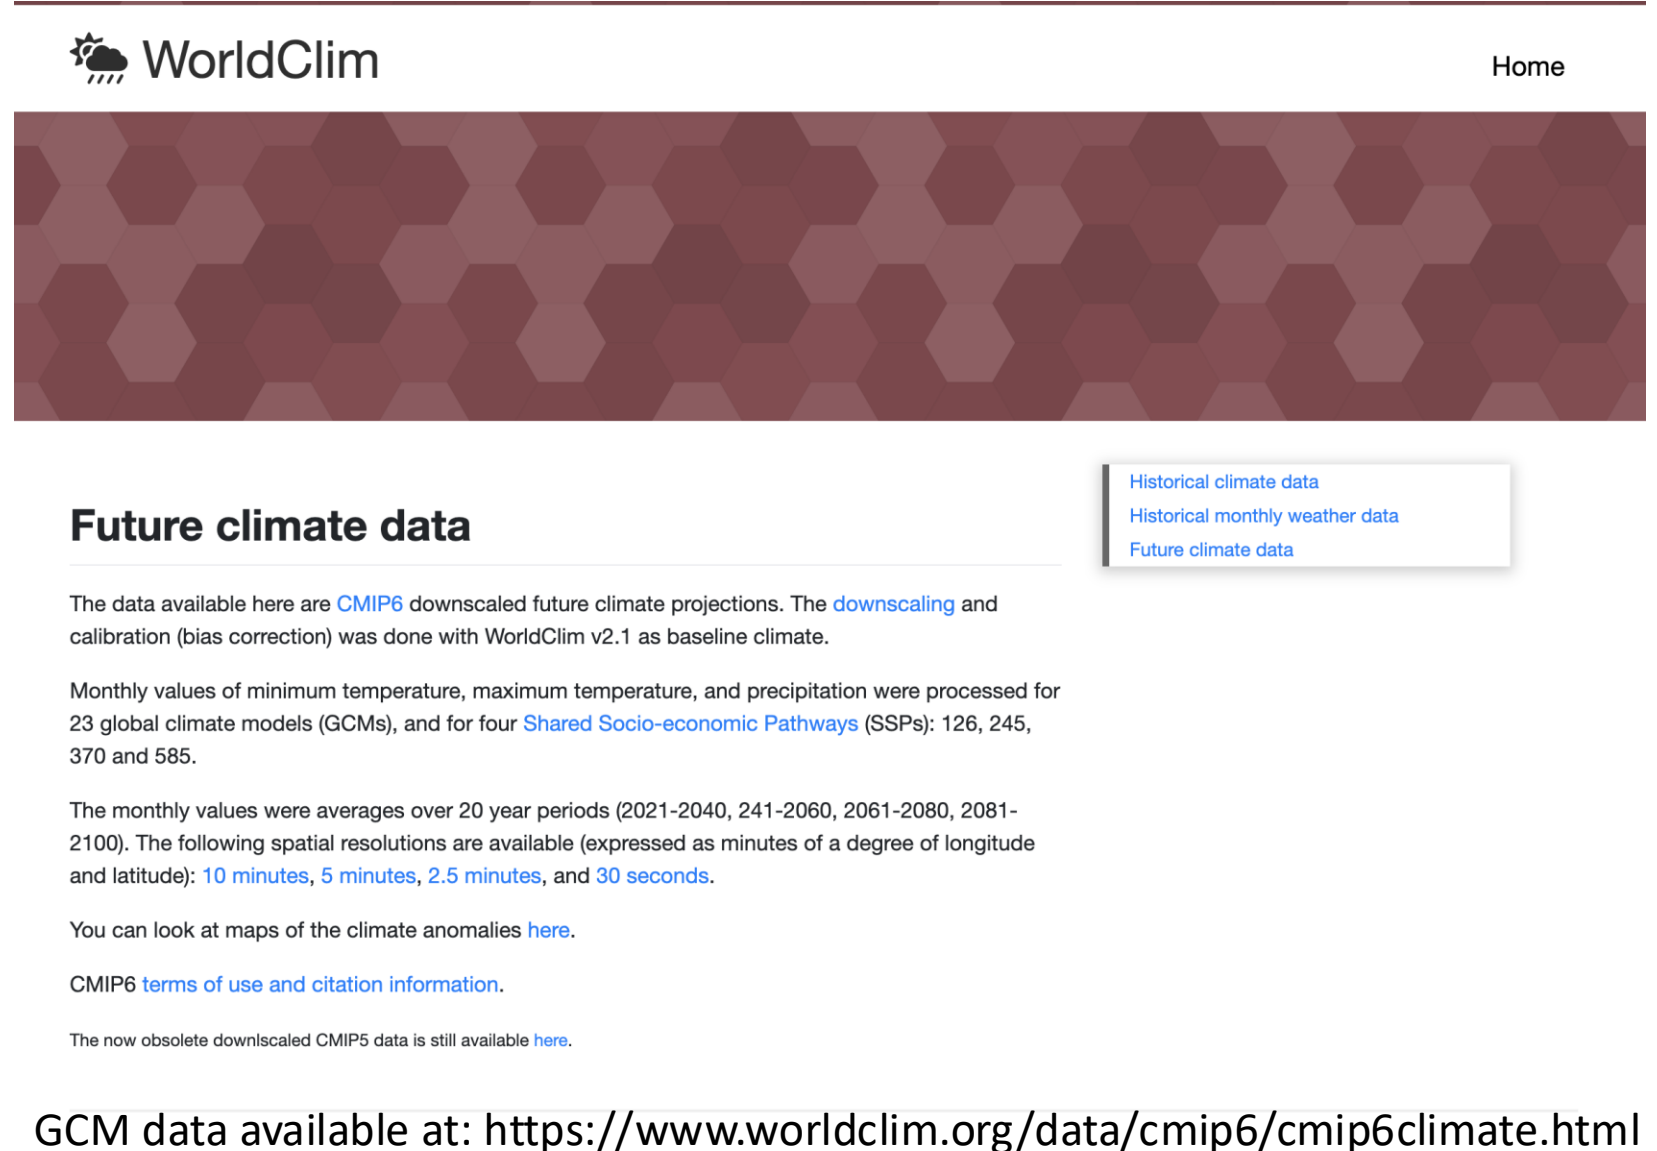

Range-based

Projecting models to future climates

- Predict potential range shifts under different climate change scenarios
- Assess vulnerability of rare or endemic species
 - Inform conservation planning

The screenshot shows the WorldClim website interface. At the top left is the WorldClim logo, and at the top right is a 'Home' link. Below the header is a large banner with a hexagonal pattern. To the right of the banner is a navigation menu with three links: 'Historical climate data', 'Historical monthly weather data', and 'Future climate data'. The 'Future climate data' link is highlighted. Below the banner, the 'Future climate data' section is displayed. It contains a paragraph about CMIP6 downscaled future climate projections, a paragraph about monthly values of minimum temperature, maximum temperature, and precipitation, a paragraph about monthly values being averages over 20-year periods, a paragraph about spatial resolutions, a paragraph about maps of climate anomalies, a paragraph about CMIP6 terms of use and citation information, and a paragraph about the now obsolete downscaled CMIP5 data.

Historical monthly weather data
Future climate data

Future climate data

The data available here are [CMIP6](#) downscaled future climate projections. The [downscaling](#) and calibration (bias correction) was done with WorldClim v2.1 as baseline climate.

Monthly values of minimum temperature, maximum temperature, and precipitation were processed for 23 global climate models (GCMs), and for four [Shared Socio-economic Pathways](#) (SSPs): 126, 245, 370 and 585.

The monthly values were averages over 20 year periods (2021-2040, 241-2060, 2061-2080, 2081-2100). The following spatial resolutions are available (expressed as minutes of a degree of longitude and latitude): [10 minutes](#), [5 minutes](#), [2.5 minutes](#), and [30 seconds](#).

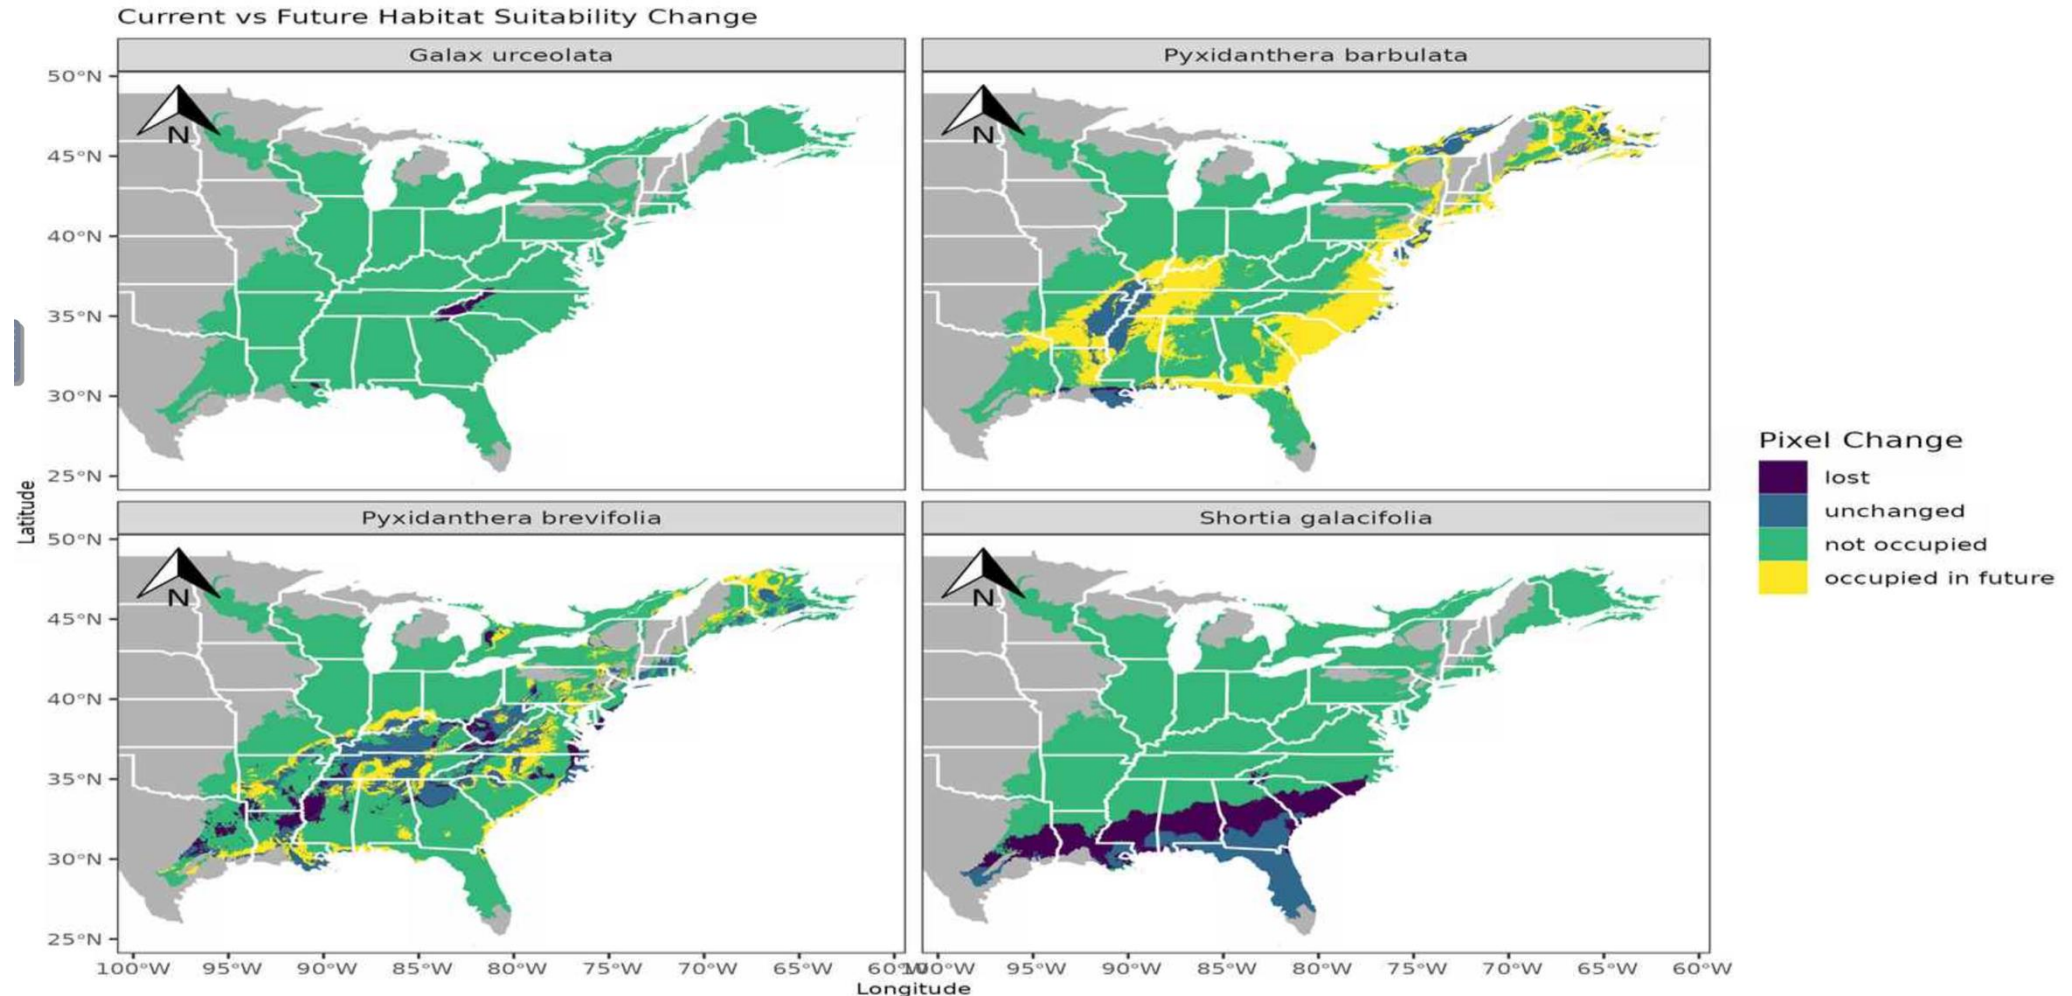

You can look at maps of the climate anomalies [here](#).

CMIP6 [terms of use and citation information](#).

The now obsolete downscaled CMIP5 data is still available [here](#).

GCM data available at: <https://www.worldclim.org/data/cmip6/cmip6climate.html>

Projecting models to future climates

Projecting models to future climates

- Caveats to accessible areas- avoid overinterpretation of models based on what you know about the region
- Uncertainty from model choice, resolution, and GCMs
